Front- to Back-Office Integration:
The Only Way to True 360° Customer Visibility and Seamless Data Consistency
Front- to Back-Office Integration:  
The Only Way to True 360° Customer Visibility and Seamless Data Consistency
Executive Summary

Independent research suggests that the area of back office connectivity is not adequately addressed by many CRM implementations, meaning, customer data cannot be shared effectively and business processes are prone to errors, delays, and unnecessary paperwork. Over the long term, this will significantly and negatively impact overall customer satisfaction, as well as increase transactional costs on an exponential basis.

This White Paper demonstrates how front- to back-office integration enables small and midsized businesses (SMBs) to address these issues. Specifically, it details how integration-ready solutions within the Sage Accpac Extended Enterprise Suite allow SMBs to seamlessly connect their business processes, applications, and data to (1) manage customer relationships more effectively, (2) reduce costs, and (3) increase profitability over the long term. Significantly, this can be achieved without the cost and complexity normally associated with projects of this type.

Introduction

The primary objective of any new CRM implementation is to bring together customer data from across the company and translate it into meaningful intelligence which can then be acted upon to develop and maintain profitable customer relationships. Some CRM projects, however, have left users feeling underwhelmed by the results, particularly where enhancements to customer visibility have failed to meet pre-project expectations or company requirements.

Gartner research suggests that significant information “blindspots” still exist after many CRM project rollouts, particularly with regard to customer transaction history. One potential explanation is that these projects have not adequately addressed the issue of back-office connectivity. Overly “front-heavy” implementations can result in the operation of two parallel but separate customer datasets; one in the back office which is financial, transactional, and quantitative in nature, and the other in the front office which, by contrast, is non-financial, interactional, and qualitative, leading to two very different pictures of the same transaction or customer.

Customer Management and Business Process Challenges

Different departments use different application types to manage customer information. Front office employees use CRM applications that support customer-facing activities such as sales, marketing, and customer service, while back office employees use ERP applications to process transactional, reporting, and compliance activities such as invoicing, accounts receivable, cashflow management, and financial reporting.

While front office applications have historically been developed around the idea of cross-organizational collaboration, back office applications, by contrast, have been insular in nature, with the finance department slow to open up its data and applications to other parts of the organization. Additionally, many companies have continued to purchase their CRM and ERP applications from separate specialist vendors. This combination of factors has meant that business applications have struggled to address key business process needs where the customer life cycle crosses the front- to back-office divide, resulting in (1) departmental silos of information, (2) unnecessary administrative overhead and inefficiencies, (3) verbalized sign-off requirements, and (4) process duplication.
Given the number of potential parties involved in the quote-to-cash cycle—including account management, sales order processing, shipping, and accounts receivable—errors or omissions at any stage in the process can be costly and time-consuming. Additionally, front office staff, such as account managers or customer service agents, may struggle to provide order status updates to their customers because of limited visibility to the transactional information contained in the back office system.

The workflow management capabilities of today’s ERP and CRM applications have helped address these issues by introducing exceptions monitoring, mandatory fields, and removing the need to re-enter and re-check information as transactions pass from one stage to the next. However, these measures do not fully address quote-to-cash business process requirements if the back office environment remains disconnected from the front office system. For example, if a member of the sales team generates a quote based on out-of-date pricing information or stock availability, and subsequently converts this quote into a customer order, it is likely that this error will only be identified later at the order approval or shipping stages. The order will need to be passed back to the salesperson for correction and then re-processed by the finance department. As a result, order completion is delayed for the customer, administrative costs increase for the company, and workload is unnecessarily duplicated for sales and finance staff. Clearly, where this scenario arises on a regular basis, it will negatively and significantly impact overall customer satisfaction, as well as increase transactional cost exponentially.

Fundamentals of Front-to-Back Office Integration

The aim of front-to-back-office integration is to bring together disconnected business processes (such as quote-to-order and order-to-cash as part of the overall quote-to-cash cycle), applications (CRM and ERP), and datasets (financial and non-financial), and translate them into a mechanism to:

1. Manage customer relationships more effectively
2. Reduce costs
3. Increase profitability
4. Achieve sustainable competitive advantage over the long term
In simple terms, front- to back-office integration is made up of three inter-related elements:

1. Consistent data between related entities (such as company and account) within the CRM and ERP applications
2. 360° customer visibility, regardless of whether customer data originates in the CRM application or the ERP application
3. Straight-through processing which enables a user to initiate a transaction (such as booking an order) which then automatically triggers all related business processes as appropriate (order approval, shipment, invoicing, etc.) and passes seamlessly from one application (CRM) to the next (ERP) without the need for extensive manual intervention (re-keying information, paperwork, or verbal sign-off).

Front- to Back-Office Data Consistency

Being able to share consistent data between the CRM and ERP applications is an essential requirement for front- to back-office integration. Customer data, however, is structured according to specific application types, so organizations need to be able to create dynamic links from entities within their CRM system (such as the “company entity”) to the corresponding entity within their ERP system (such as the “account” entity), whereby changes in either are propagated in both. This ensures that both front office and back office staff are working with the same information, which reduces or removes the need for re-work and the potential for error.

In the quote-to-cash example cited previously, these capabilities would enable the account manager to generate a quote based on the most accurate and up-to-date information available at the time and, as a result, eliminates the potential for error and process duplication down the line.

360° Customer Visibility

Enabling users to view combined financial and non-financial customer information within a single application, regardless of where the information is generated or stored, is another key requirement for front- to back-office integration.

360° customer visibility is particularly useful for account managers who may require access to a customer's purchase history or for customer service representatives who may need to update a customer on the status of an order. Providing these users with access to both financial and non-financial information eliminates the customer data “blind spots” described earlier.

In the quote-to-cash example cited previously, these capabilities would enable account managers to verify that their customers had not exceeded their credit limit prior to placing new orders. If an issue exists, it is flagged with the customer immediately rather than at a later time when the order reaches credit control. Again, this helps to eliminate errors and process duplication downstream.

Straight-Through Processing

Straight-through processes enable users to initiate complex, multi-stage transactions which, using workflow management and application integration, then automatically trigger the appropriate downstream business processes, and pass seamlessly from one application to the next without the need for extensive manual intervention. The main advantage of straight-through processes is that they reduce or remove the need to re-key information from one system to the next, reducing administrative costs and the potential for error.

In quote-to-cash situations, these capabilities could automatically generate an order in the ERP system as soon as the account manager promotes a quote to an order within the CRM Front system. This means that the order can be processed without delay and the customer benefits from a speedier turnaround. As the quote is generated using ERP-supplied pricing and tax calculations, the potential for error due to out-of-date information is eliminated and workflow automation ensures that an order does not have to be recreated manually in the ERP system, removing process duplication and ultimately reducing cost.
Challenges of Front-to Back-Office Integration for SMBs

Front-to back-office integration can help companies to dramatically reduce administrative costs, speed up order fulfillment, and improve customer service. While this may seem like a real win-win scenario for all involved, it is not without its challenges.

Undertaking point-to-point, retrospective integration can be a costly, complex, and risky proposition for SMB organizations, and even when a company manages to achieve its short-term integration objectives, there is no guarantee that future CRM or ERP upgrades will not render the integration inoperable.

The availability of CRM solutions that offer out-of-the-box, easy-to-deploy integrations with market-leading ERP solutions, therefore, represents a highly compelling proposition for SMB organizations seeking to cost-effectively leverage the benefits of front- to back-office integration.

Front-to Back-Office Integration Capabilities

The Sage Accpac Extended Enterprise Suite, which includes SageCRM with Sage Accpac ERP, means that companies which have previously invested in Sage Accpac ERP products can quickly and cost-effectively leverage their back office ERP data and functionality within the front office environment of SageCRM.
Front- to Back-Office Data Consistency

The Sage Accpac Extended Enterprise Suite facilitates the bidirectional synchronization of customer information, both financial and non-financial front- and back-offices ensuring that:

1. Information is captured once at the source and then automatically propagated to all relevant fields without having to wait for it to be re-keyed and re-validated as it passes from one system to the next.
2. The most accurate and up-to-date customer data is available to front- and back-office employees at all times.
3. The most accurate and up-to-date pricing and inventory information is available to front office staff at all times, meaning that quotes and orders are correct and that customers are accurately advised as to the lead-times of their orders using real-time information.

360° Customer Visibility

SageCRM enables front and back office employees to discover and share meaningful customer insight based on a combination of CRM- and ERP-derived intelligence. The “trading account” entity in SageCRM facilitates the mapping of multiple accounts contained within Sage Accpac ERP to their appropriate company record within SageCRM. This provides an ERP-empowered CRM user experience with customer transaction information delivered through the native CRM user interface. It also allows ERP-based customer data to be surfaced within dashboards, reports, and tabs, and used within groups, lists, and workflow automation.

The true customer visibility of Sage Accpac Extended Enterprise Suite enables:

1. Sales teams to maximize their revenue potential through the identification of latent cross-sell and up-sell opportunities within their customer base.
2. Sales representatives to book orders correctly, first time, every time, by providing them with access to the account, pricing, and stock information they need to do their jobs effectively.
3. Customer service representatives to address customer queries with confidence by providing them with the shipping, invoicing, and returns information that they need to do their jobs effectively.
4. Customer service managers to ensure that their customers are current on maintenance and service contracts, and that their service level agreements are delivered on a profitable basis.
5. Marketing executives to carry out detailed financial segmentation on their customer bases to support highly targeted and effective go-to-market programs.
6. Marketing managers to calculate “real-world” return-on-investment based on actual revenue yield from their marketing programs.

The following table provides a sample of the ERP-derived customer data that can be presented to front office staff through front- to back-office integration.

<table>

Facilitating Straight-Through Processing

The out-of-the-box integration of SageCRM with Sage Accpac allows companies to implement straight-through business processes that provide the workflow and automation capabilities to manage the entire customer life cycle seamlessly across all interaction and transaction types. Specifically, the quotes and orders functionality bridges the process automation capabilities of the front- and back-office environments and removes the need for manual intervention as orders generated within the CRM system are passed automatically through to the ERP system for processing and fulfillment. Additionally, front office staff are equipped with the data and functionality they need from the back office system to carry out complex pricing and tax calculations, as well as with real-time inventory information to ensure orders are fulfilled on a timely basis according to customer expectations.

Once an order has been created in SageCRM, a corresponding order is automatically generated in Sage Accpac ERP where it can be processed immediately. Delays and errors are eliminated because: (1) accurate pricing and tax calculations have been carried out within the CRM system at the point of entry, and (2) the order already includes all of the data required by the ERP system. As a result, companies can realize consistently significant cost and time savings while significantly enhancing customer service through accurate, timely order fulfillment.

The following diagram illustrates the uninterrupted, optimized, cost-efficient, and customer-centric front- to back-office process flow that Sage Accpac Extended Enterprise provides.

Sage Accpac Extended Enterprise front- to back-office full process automation
Self-Service Enablement
SageCRM also provides the capability to deliver key CRM functionality directly to customers through a self-service Web portal which, when combined with front- to back-office integration, allows customers to:

1. Access their full account details online, including in voice and delivery history.
2. Configure and place orders online using pricing rules that automatically incorporate company-specific volume purchase agreements and discount structures.
3. Query order and delivery status online, as well as proof-of-delivery details.

Cost-Effective, Flexible, and Upgrade-Ready Integration Platform
The front- to back-office integration capabilities of the Sage Accpac Extended Enterprise are particularly cost-compelling for organizations that have already invested in a Sage Accpac ERP back office solution. Specifically, the integration component can be deployed using minimal consulting resources and, generally, without the need for additional hardware infrastructure. Also, because the front- to back-office integrations are loosely coupled and SOA-based, they are upgrade safe and facilitate future migration from one Sage Software ERP product to another while minimizing cost and risk.

Conclusion
Independent research suggests that customer intelligence gaps still exist after the majority of CRM implementations because the issue of back office connectivity has not been adequately addressed. Where this is the case, customer data cannot be shared effectively and business processes are punctuated by errors, delays, and unnecessary paperwork, likely resulting in customer satisfaction issues and spiraling administrative costs. The success of a CRM project, therefore, should not be judged solely on how effectively it brings together front office operations, but also on how it facilitates interoperation with the back office environment—encompassing people, processes, departments, and applications.

Front- to back-office integration harnesses business processes, applications, and data to manage customer relationships more effectively, reduce costs, increase profitability, and give the organization a sustainable competitive advantage over the long term. Front- to back-office integration, however, can be costly and complex for many companies, especially SMBs, and often pre-packaged integration solutions are the most effective alternative for these organizations.

Sage Accpac Extended Enterprise Suite combines two market-leading products – SageCRM and Sage Accpac ERP – to give SMBs access to their customer data across their front- and back-office environments. It also facilitates straight-through processing which significantly reduces errors and administrative costs. Over the long term, companies using the front- to back-office integration capabilities within the Sage Accpac Extended Enterprise Suite can expect to significantly decrease administrative costs, increase customer satisfaction and consequential revenue opportunities, and build a sustainable competitive advantage in an increasingly challenging marketplace.

Additional Information
Further information on the front- to back-office integration capabilities within the Sage Accpac Extended Enterprise Suite can be obtained by contacting Sage Accpac sales at 1-800-945-8007, or your certified Sage Accpac business partner.

About Sage Software

Sage Software supports the needs, challenges and dreams of nearly 2.8 million small and mid-sized business customers in North America through easy-to-use, scalable and customizable software and services. Our products support accounting, operations, customer relationship management, human resources, time tracking, merchant services and the specialized needs of the construction, distribution, healthcare, manufacturing, nonprofit and real estate industries. Sage Software is a subsidiary of The Sage Group plc, a leading global supplier of accounting and business management software solutions and related products and services for small and mid-sized businesses.

For more information or to find out how our Extended Enterprise Suite of applications can help your business, visit us at www.sageaccpac.com or call 1-800-945-8007 today.
